- All Maximum Concentration Values (MVC) are extracted from different legislative forms (i.e. RoHS Directive). Not all substances appear in the legislative forms - in such cases the MVC is set to N.A.

This analysis was conducted by two means:

1) A theoretical analysis conducted by N-ES Engineering Solutions Ltd.
   The inspection was ordered by Aladdin and included:
   - A thorough review of all BOM components datasheets.
   - All manufacturers RoHS compliancy declarations.

2) A chemical analysis conducted by SPECTROLAB – Analytical Laboratory Ltd.
   The examination was conducted to the keys as a whole. The Chemical analysis purpose was to back up the technological analysis findings.
   The RoHS directive is referring to homogenous material only. In order to prevent any misunderstandings the chemical test results were left out.
